integrity constraints are semantic conditions that a database should satisfy in order to be an appropriate model of external reality in practice and for many reasons a database may not satisfy those integrity constraints and for that reason it is said to be inconsistent however and most likely a large portion of the database is still semantically correct in a sense that has to be made precise after having provided a formal characterization of consistent data in an inconsistent database the natural problem emerges of extracting that semantically correct data as query answers the consistent data in an inconsistent database is usually characterized as the data that persists across all the database instances that are consistent and minimally differ from the inconsistent instance those are the so called repairs of the database in particular the consistent answers to a query posed to the inconsistent database are those answers that can be simultaneously obtained from all the database repairs as expected the notion of repair requires

an adequate notion of distance that allows for the comparison of databases with respect to how much they differ from the inconsistent instance on this basis the minimality condition on repairs can be properly formulated in this monograph we present and discuss these fundamental concepts different repair semantics algorithms for computing consistent answers to queries and also complexity theoretic results related to the computation of repairs and doing consistent query answering table of contents introduction the notions of repair and consistent answer tractable cqa and query rewriting logically specifying repairs decision problems in cqa complexity and algorithms repairs and data cleaning

with the rapid growth in the use of computers to manipulate process and reason about multimedia data the problem of how to store and retrieve such data is becoming increasingly important thus although the field of multimedia database systems is only about 5 years old it is rapidly becoming a focus for much excitement and research effort multimedia database systems are intended to provide unified frameworks for requesting and integrating information in a wide variety of formats such as audio and video data document data and image data such data often have special storage requirements that are closely coupled to the various kinds of devices that are used for recording and presenting the data and for each form of data there are often multiple representations and multiple standards all of which make the database integration task quite complex some of the problems include what a multimedia database query means what kinds of languages to use for posing queries how to develop compilers for such languages how to develop indexing structures for storing media on ancillary devices data compression techniques how to present and author presentations based on user queries although approaches are being developed for a number of these problems they have often been ad hoc in nature and there is a need to provide a principled theoretical foundation
