the author has sought to incorporate in the book some of the fundamental concepts and principles of the physics and dynamics of the atmosphere a knowledge and understanding of which should help an average student of science to comprehend some of the great complexities of the earth atmosphere system in which a thr way interaction between the atmosphere the land and the ocean tends to maintain an overall mass and energy balance in the system through physical and dynamical processes the book divided into two parts and consisting of 19 chapters introduces only those aspects of the subject that according to the author are deemed essential to meet the objective in view the emphasis is more on clarity and understanding of physical and dynamical principles than on details of complex theories and ma ematics attempt is made to treat each subject from rst principles and trace its development to present state as far as possible however a knowledge of basic c culus and differential equations is sine qua non especially for some of the chapters which appear later in the book

global navigation satellite system gnss monitoring of the atmosphere is an interdisciplinary topic a collaboration between geodetic and atmospheric communities as such this topic requires sufficient basic knowledge about both gnss and the atmosphere global navigation satellite system monitoring of the atmosphere begins by introducing gnss its components and signals it then explains the basics of the atmosphere starting from the ionosphere to the troposphere the gnss tropospheric monitoring is separated for application in numerical weather prediction and nowcasting further chapters focus on the application of gnss for monitoring the climate as well as soil moisture finally the book concludes by discussing gnss processing along with introducing the latest developments and applications for using atmospheric data to provide precise real time gnss products explains the basics of gnss positioning and signals includes the state of the art in gnss observations of the atmosphere and hydrosphere presents the basics of numerical weather prediction and analysis

the discovery of new elementary gas in the atmosphere in 1894 aroused much interest and public attention has again been directed to the air which was for many centuries a fruitful field for speculation and conjecture the account of this discovery communicated to the royal society in january 1895 was however necessarily couched in scientific language and many matters of interest to the chemist and physicist were written in an abbreviated style in the knowledge that the passages describing them would be easily understood by the experts to whom the communication was primarily addressed but persons without any special scientific training have frequently expressed to me the hope that an account of the discovery would be published in which the pg vi conclusions drawn from the physical behaviour of argon should be accompanied by a full account of the reasoning on which they are based an endeavour to fulfil this request is to be found in the following pages and as the history of the discovery of the better known constituents of the atmosphere is of itself of great interest and leads up to an acquaintance with the new stranger who has so long been with us incognito an effort has here been made to tell the tale of the air in popular language
