there is a very simple and fundamental concept to much of probability and statistics that can be conveyed using the following problem problem assume a finite set universe of n units where a of the units have a particular attribute the value of n is known while the value of a is unknown if a proper subset sample of size n is selected randomly and a of the units in the subset are observed to have the particular attribute what can be said about the unknown value of a the problem is not new and almost anyone can describe several situations where a particular problem could be presented in this setting some recent references with different focuses include cochran 1977 williams 1978 hajek 1981 stuart 1984 cassel samdal and wretman 1977 and johnson and kotz 1977 we focus on confidence interval estimation of a several methods for exact confidence interval estimation of a exist buonaccorsi 1987 and peskun 1990 and this volume presents the theory and an extensive table for one of them one of the important contributions in neyman 1934 is a discussion of the meaning of confidence

interval estimation and its relationship with hypothesis testing which we will call the neyman approach in chapter 3 and following neyman s approach for simple random sampling without replacement we present an elementary development of exact confidence interval estimation of a as a response to the specific problem cited above
